# Seven Ways to Utilize Data Center Space
Refresh Technologies

Enhance power, increase operational efficiency, and reduce power consumption using new technologies.
Use Small-Diameter Cables

Enable more equipment to be stored in rack space, reducing the need for additional cable management solutions.

Try Virtualization Solutions

By distributing workloads over several servers, you can reduce the need for new servers.
Improve Architecture Efficiency

Take into account the existing layout, upcoming servers, and equipment to determine how these components will work together.
Optimize Vertical Space

Use vertical space to expand your data center's capacity and density without taking up floor space.

Increase Cabinet Power Density

Reducing the need for cabinet and management equipment requirements while boosting your company's return on investment.

Use Cooling Technology

Technologies such as hot/cold aisle containment can help save data center space while maintaining appropriate temperatures.
